EEG can provide evidence for underlying diffuse or focal cerebral dysfunction through demonstration of background slowing. The two main types of slowing are focal and generalized slowing. As previously discussed, generalized background slowing in the theta and delta frequency ranges is a normal

posterior dominant rhythm. The posterior dominant rhythm (PDR) is the resting frequency of the occipital region when eyes are closed and the patient is resting quietly. It is a vital part of a normal EEG and among the first things you should look for; the PDR used to be called the alpha rhythm because the normal PDR (8.5-12 Hz) is in the alpha
