Course Description. This course develops the fundamentals of feedback control using linear transfer function system models. Topics covered include analysis in time and frequency domains; design in the s-plane (root locus) and in the frequency domain (loop shaping); describing functions for stability of certain non-linear systems; extension to state variable systems and multivariable control with observers; discrete and digital hybrid systems and use of z-plane design.

Experiment 81 - Design of a Feedback Control System 201139030 (Group 44) ELEC273 May 9, 2016 Abstract This report discussed the establishment of open-loop system using FOPDT model which is usually used to approximate high-order system, closed-loop system with different types of controllers, and systems under disturbance signal.

Experiment 81 - Design of a Feedback Control System

1.3 Design of Feedback Control Systems. Feedback control systems must be designed to suit a predetermined purpose. Normally, only the controller can be appropriately designed, whereas the process and the sensor are predetermined or constrained. Feedback control systems can be designed to achieve specific behavior of the output variable, for example.

This book shows root locus and Bode plots of state space design problems and clearly links the two sides. Other books follow the treatment of this great book. The only shortcoming is a lack of nonlinear analysis and a weak digital control treatment. But for continuous linear systems this is a great book to learn from. It is also great for self ...

Feedback System Block Diagram Model This basic feedback loop of sensing, controlling and actuation is the main concept behind a feedback control system and there are several good reasons why feedback is applied and used in electronic circuits: Circuit characteristics such as the systems gain and response can be precisely controlled.

Feedback Systems and Feedback Control Systems

In a positive feedback control system the setpoint and output values are added. In a negative feedback control the setpoint and output values are subtracted. As a rule negative feedback systems are more stable than positive feedback systems. Negative feedback also makes systems more immune to random variations in component values and inputs.
