a simplex t , $f_1; 2; \dots; d+1$ is the local index set of t . The matrix elem is the mapping (pointer) from the local index to the global one, i.e., $\text{elem}(t, 1:d+1)$ records the global indices of $d+1$ vertices which form the abstract d -simplex t . Note that any permutation of vertices of a simplex will represent the same abstract simplex.

a) Gauss reduction method (some of you have mistaken this for the iterative Gauss-Jordan method, I guess): this is not just a method but a way to understand a linear map (and a system of equations) in a much simpler way, and of getting information by itself (i.e. the eigenvalues). Same for the Jordan decomposition result (but this is a bit ...
