Turbulent Transport in Magnetized Plasmas

Turbulent transport of magnetized plasma is important in nature as well as in many laboratory experiments [1,2], fusion related studies in particular [3,4]. The dominant mechanism is in many cases found to be transport by low-frequency electrostatic waves that are strongly magnetic field aligned, i.e. flute like.

Turbulent Transport in Magnetized Plasmas. undefined. The book explains how magnetized plasmas self-organize in states of electromagnetic turbulence that transports particles and energy out of the core plasma faster than anticipated by the fusion scientists designing magnetic confinement systems in the 20th century. It describes theory, experiments and simulations in a unified and up-to-date presentation of the issues of achieving nuclear fusion power.

Turbulent Transport in Magnetized Plasmas | FuseNet

The turbulent transport mechanisms created in the laboratory are explained in detail in the second edition of "Turbulent Transport in Magnetized Plasmas" by Professor Horton. The principles and properties of the major plasma confinement machines are explored with basic physics to the extent currently understood.

Turbulent Transport in Magnetized Plasmas

Particle transport in magnetized plasmas is investigated with a fluid model of drift wave turbulence. An analytical calculation shows that magnetic field curvature and thermodiffusion drive an...

this kind of turbulent dynamics, it might be useful to introduce plasma turbulence by stressing the similarities and differences with respect to uid turbulence. First, turbulence in magnetized plasmas is quasi-two-dimensional. The strong background magnetic field leads to a strong anisotropy in the plasma particles' motion. While they are able to move

The transport character is determined by the interaction of the suprathermal ion orbits with the turbulent plasma structures, which in turn depends on the ratio between the ion energy and the background plasma temperature.

Gradient driven electrostatic instabilities are investigated in TORPEX [A. Fasoli, B. Labit, M. McGrath, S. H. Müller, M. Podestà, and F. M. Poli, Bull. Am. Phys. Soc. 48, 119 (2003)], a toroidal device (R=1m, a=0.2m) in which plasmas are produced by microwaves (P<=20kW) with f_{rf}=2.45GHz, in the electron cyclotron frequency range. Typical density and temperature are n_e≤10¹⁷m⁻³ and T_e ...

Cross-field heat and particle transport in fusion plasmas are only partly caused by the collisional mechanisms described by neoclassical transport theory. Indeed, the measured heat diffusivity is higher than expected from neoclassical prediction—this is what is called 'anomalous' transport (see, e.g.) due to turbulence.

Turbulent particle transport in magnetized fusion plasma ...

Turbulent low frequency electrostatic fluctuations are identified as one of the most effective transport mechanisms of plasmas across magnetic field lines. These phenomena are studied by laboratory experiments in magnetized toroidal plasmas (in part by use of existing data from the Blaumann experiment), and also by analytical methods.

Turbulent transport in magnetized plasmas - Department of ...

Turbulence and transport The pressure gradient allows small perturbations to grow. Plasmas as any system are constantly exposed to perturbations, external (not perfect control) to internal (see waves). A perturbation in a plasma results in perturbations in the velocity, but also in the local density and the potential.
